

Nest Key Field Trip

Grade Level: All

Summary: The Nest Key field trip is a boat trip into true backcountry waters. While walking on Nest Key, a mangrove island, students will observe the island habitat mangroves create. A seining activity in the waters adjacent to the island will provide students a hands on look at some of the unique organisms we have in our backcountry waters.

Program Objectives:

- Students will walk through a mangrove island
- Students will use a seine net to observe organisms within Florida Bay's backcountry waters

Concepts Covered:

- Mangrove island zonation
- Mangrove island as a habitat
- Seine net fishing

Vocabulary: seine, backcountry, island zonation, salt tolerant vegetation

Procedures: Students will board boats to go to Next Key, a mangrove island in Florida Bay, within the Everglades. Once at the island, we will discuss mangrove island growth and development. Students will walk a short trail from the edge to the middle of the island to observe island zonation and the shift from mangroves to salt tolerant trees. Afterwards, seine net fishing will be discussed and students taught the proper techniques for using a seine net. The discussion will be put into practice as students work as a group to seine. Any organisms "caught" will be passed around, discussed and returned to the water.

Extensions: We can shorten the Nest Key activity/lesson in order to accommodate a brief mangrove/seagrass snorkel
